

The window has opened at 0600 UT but the rocket is in the horizontal position. The ground level winds are gusting to 20 m/s which is too high for the styrofoam box and the higher altitude winds, up to 10 km, are from the south and too high to safely launch.

On the positive side there is aurora and some outflow here in Longyearbyen. The solar wind is faster and denser. Generally the magnetosphere is more active.

More later.

Paul
