# iSkysoft iMedia Converter
## Capture Clips from a DVD

**I**MPORTANT: **All** media projects must be compliant with current **Dartmouth College Policy** and **Federal Copyright laws**. For more information please refer to http://www.dartmouth.edu/copyright/
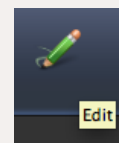

1. Insert the disc into the Mac DVD drive. If the DVD automatically begins playing, exit the DVD player program.

2. Open iSkysoft iMedia Converter Deluxe by clicking the icon in the dock and select **Video** as the output option.
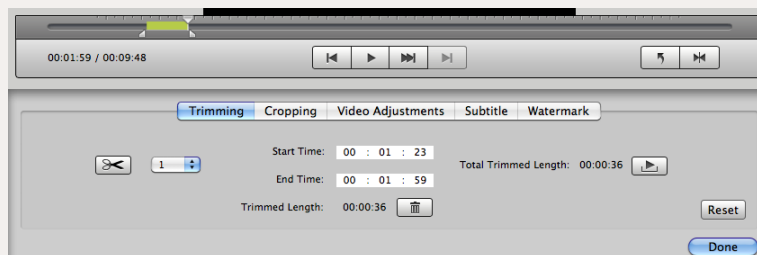

3. A prompt will appear asking if you want to load the DVD. Click **OK**. The imported files appear listed in the window with respective thumbnails. Note: You can also import video by dragging the files or DVD disk icon directly to the iMedia Converter window.

4. To import selected clips from the disc, click the green pencil icon. iSkysoft will switch to **Edit** mode.

5. Navigate the playhead to a particular scene and click the scissors icon. Set the in/out points for your clip by dragging the two markers in the timeline.

6. To import multiple clips, repeat step 5. Click **Done** to return to the main Converter screen.

7. Click the format icon next to the green pencil icon to open the output format list. Choose a video format from the drop-down list. If you plan to use the clip in an iMovie project, select the **iMovie** preset listed under **Apple Software**.

8. After you enter the settings, click the **Convert** button to start the conversion process. This may take several minutes. iSkysoft places converted files in the **Video Converted** folder (**Movies** > **iSkysoft iMedia Converter Deluxe** > **Video Converted**). The folder opens automatically after the conversion is finished.
