iSkysoft iMedia Converter
Capture Clips from a DVD

IMPORTANT: All media projects must be compliant with current Dartmouth College Policy and Federal Copyright laws. For more information please refer to http://www.dartmouth.edu/copyright/

1. Insert the disc into the Mac DVD drive. If the DVD automatically begins playing, exit the DVD player program.

2. Open iSkysoft iMedia Converter Deluxe by clicking the icon in the dock.

3. From the file menu, select Load DVD Files and select the DVD at the bottom of the sidebar in the Finder window that pops up. Then click the Load button. The imported files appear listed in the window with respective thumbnails. Note: You can also import video by dragging the files or DVD disk icon directly to the iMedia Converter window.

4. To import selected clips from the disc, click the pencil icon. iSkysoft will switch to Edit mode.

5. Click the scissors icon to activate the Trimming toolbar.

6. Navigate the playhead to a particular scene and click the “Add trim marker” button. To adjust in/out points of your selection, drag the markers in the timeline.

7. To import multiple clips, repeat Step 6. When you are finished, click on the green check mark. Close the Edit window to return to the main converter screen.

8. Choose a video output format from the bottom toolbar. If you plan to use the clip in an iMovie project, select the iMovie preset listed under Editing.

9. From the Output pull-down menu, select a destination for your clips. Click the Convert button to start the conversion process. Converting video may take several minutes. To quickly access your converted files, click the Open Output Folder button.
